## 原理 Principle

### TH款的分离原理 Mechanism of oil/water separation

分散在水清洗剂中微小的油滴通过用滤芯纤维过滤器过滤后,使其变成

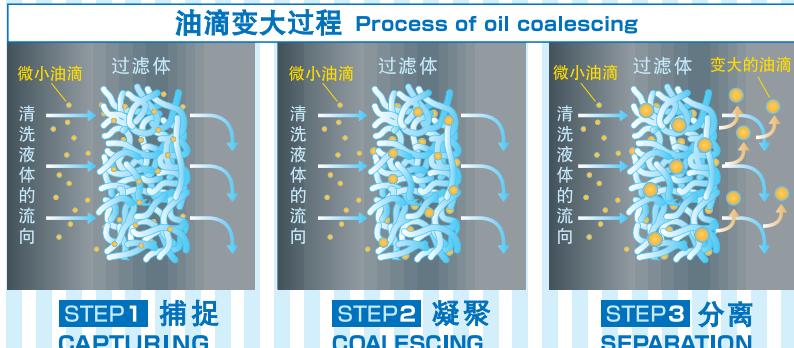

1~2mm φ左右大小,在容器内根据比重的差瞬间得到分离。

飘浮在容器顶部的油,由液位测试仪检测其位置,并自动排出。

Fine oil droplets dispersed in the aqueous cleaner coalesce into one or two millimeter in the fiber network of the EUTEC™ cartridge, and mixture separates instantaneously into two layers immediately on its emergence into the vessel chamber.

Oil from the upper stratum is discharged through the oil vent via the solenoid valve whenever it is opened the level switch.

## 原理 Principle

### EUTEC™ MF的原理 Filtration System Configuration and Mechanism

被处理流体从装置侧面的流入,按OUT→IN顺序通过过滤筒。

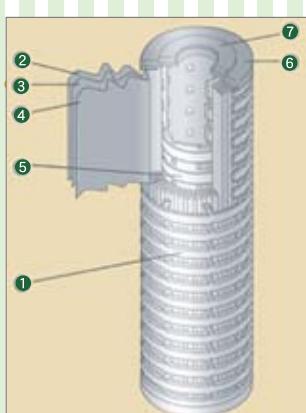

大颗粒沉降到装置的底部,小颗粒被过滤,

杂物被去除变为干净的流体在底部的出口被排出。

由于去除液体中的颗粒,过滤筒的入口压力上升,

随之将达到交换差压(入口和出口的压力之差)。

The target liquid is fed into the filtration vessel under pressure, passes through the microfilter cartridge element to its core, and from there to the vessel outlet. Particles in the feed liquid which are too large to enter the element settle to the bottom of the vessel chamber, and finer particles enter and are entrapped in the ultrafine-fiber network of the element. As the fine particles accumulate in the element, the pressure differential across the element gradually increases to a limiting value, and the cartridge must then be replaced.
